

UX / UI DESIGN BRIEF

TableWorx

Look, Feel & Experience Recommendations — pre-build design direction

Prepared for: TableWorx (pty) Ltd.

Site reviewed: tableworx.ai (current Wix build)

Purpose: to establish an agreed visual and experience direction before the production build begins.

Date: August 2026

UI/UX: Storm Morrisby

1. Executive Summary

TableWorx has a genuinely strong product story — an offline-first, three-pillar ecosystem (KDS, Waiter App, Customer App) built specifically for independent restaurants. The current site is a solid first placeholder, but it reads as a Wix template rather than a piece of hospitality-tech software the owner would trust with their front-of-house. Before development starts, the goals below should anchor every design decision:

- Make the product feel real. Replace AI-generated stock imagery and generic icons with actual screens (or high-fidelity mockups) of the KDS, Waiter App and Customer App.
- Give every page a job to do. Right now almost every button points back to the homepage. Each section needs a real destination and a next step.
- Sell the differentiator, don't just mention it. "Offline-first" is the strongest claim on the page and currently gets one line, twice, with no visual support.
- Design for the buyer, not just the diner. A restaurant owner needs pricing signals, proof, and a low-friction way to book a demo — none of which exist today.
- Build a warm, tactile, hospitality-grade visual identity — not a generic SaaS blue-and-white template.

2. Current Site — What's Working, What's Not

2.1 What's working

- The headline and opening paragraph communicate the value proposition clearly: efficiency + hospitality, digital convenience + traditional service.
- The "three pillars" structure (KDS / Waiter App / Customer App) is a clean, memorable way to organize the product.
- The services page detail (station-specific KDS views, expo mode, tip tracking, bill-splitting) is genuinely compelling, feature-rich copy — this content just needs a better stage.

2.2 What's holding it back

No clear call to action

There is no "Book a Demo," "Get Started," or "Contact Sales" button anywhere on the homepage. For a B2B sales site, this is the single highest-impact fix — a visitor who is sold on the product currently has no obvious next step.

Dead-end links

"Learn More," "Discover Technology," and all three "View More..." links on the homepage point back to the homepage itself instead of the relevant service section or page. This breaks trust quickly — it signals an unfinished site rather than a considered one.

Placeholder social links

The Instagram, Facebook and LinkedIn icons in the header link to Wix's own template accounts, not TableWorx's. This is an easy but important fix before launch — broken or generic social proof undermines credibility instantly.

Imagery doesn't build trust

Visuals are AI-generated placeholders (visible in the file names) rather than real product screens. For software that a restaurant owner is being asked to run their entire floor on, seeing the actual KDS ticket screen or the waiter's table map does more to sell the product than any illustration.

Repeated content, no page differentiation

The Home and Services pages currently repeat the "Three Pillars" intro almost verbatim. Home should sell the vision in a few scannable seconds; Services should be where the depth lives.

No proof, no pricing, no path to "yes"

There are no customer logos, testimonials, stats, or pricing tiers — all standard trust-builders for restaurant-tech buyers who are comparing several vendors before they'll commit.

Generic navigation

The nav still reads "More" (an unedited Wix default) and offers no way to jump to Pricing, a specific pillar, or a demo booking flow.

3. Information Architecture & Navigation

Recommended top-level structure — flatter and sales-oriented, with the demo CTA persistent in every state:

- Product → overview + jump links to KDS / Waiter App / Customer App
 - How It Works → the guest-to-kitchen-to-payment flow, visualized
 - Pricing → even a simple "starts from" or "request a quote" tier removes friction
 - About → the TableWorx story and who it's built for (independent restaurants)
 - Contact / Book a Demo → short form, always reachable
- Persistent header: logo (left), 4–5 nav items (center or left-aligned), single high-contrast "Book a Demo" button (right) that stays visible on scroll.

3.1 Recommended homepage flow

Section	Purpose
1. Nav	Sticky header, logo, streamlined menu, persistent "Book a Demo" button.
2. Hero	Headline + one-line subhead + primary/secondary CTA + a real device mockup (tablet KDS + phone waiter app + phone customer app, angled together).
3. Proof strip	"Built for independent restaurants" — even 3–4 early partner logos, or a single strong stat, builds instant credibility.
4. Three Pillars	Interactive cards or tabs, each with a real screenshot, 2–3 bullets, and its own "Explore →" link to a dedicated anchor or page.
5. Why Offline-First	A dedicated section — icon + short explainer — turning the strongest differentiator into a visible selling point, not a buried line.

Section	Purpose
6. How it works	A 4-step visual flow: Guest scans QR → orders & splits → kitchen sees it on KDS → waiter notified, paid, table turned.
7. Social proof	Testimonial quote(s) or "as trusted by" once available; leave a designed placeholder slot even pre-launch.
8. Final CTA banner	"Ready to modernize your floor?" with the demo form embedded directly — don't make this the only path to contact.
9. Footer	Full sitemap, correct social links, contact details, legal — currently the footer is contact info only.

4. Visual Identity Direction

The current template reads as generic SaaS (white background, default blues, stock-feeling AI art). The recommendation is a warmer, more tactile "modern hospitality" identity — confident and technical enough to read as serious software, warm enough to feel like a restaurant brand rather than a spreadsheet tool.

4.1 Colour palette

FOUNDATION

	Role	Name	Hex
	Primary / Ink	Near-black text & header	#1C1B1A
	Background	Warm paper (not stark white)	#FAF7F2
	Divider / border	Hairline rules, card borders	#E4DFD6
	Surface	Cards, elevated panels	#FFFFFF

ACCENT

	Role	Name	Hex
	Primary accent	Ember — CTAs, links, highlights	#3D8091
	Secondary accent	Deep teal — headings, icons, contrast blocks	#16504A

KDS STATUS COLOURS (FUNCTIONAL, FOR PRODUCT UI + MARKETING DIAGRAMS)

	Role	Name	Hex
	Queue	Amber — waiting to start	#F2B705
	Preparing	Blue — in progress	#2F6FED
	Ready	Green — ready to serve	#1FAE6B

Why this direction: near-black-on-warm-paper feels premium and legible (better contrast than pure white), the ember accent nods to fire/kitchen/hospitality without being a cliché red, and the status triad gives the KDS its own honest, functional colour language that can be reused directly in product screenshots on the marketing site.

4.2 Typography

Role	Direction
Headings	A confident grotesk/geometric sans (e.g. Söhne, General Sans, or Inter Tight). Tight letter-spacing, bold weight, used sparingly in large sizes for impact.
Body	Inter or Public Sans at 16–18px minimum, generous line-height (1.5–1.6) — the current body copy is dense; more breathing room will make long feature lists (like the Services page) far easier to scan.
Numerals / stats	A slightly condensed or tabular numeral style for any stat callouts (e.g. table-turnover %), so they read as data, not decoration.

4.3 Imagery & iconography

- Replace all AI-placeholder art with real product screenshots framed in clean device mockups (tablet for KDS/waiter, phone for the guest app).
- If real screens aren't ready yet, commission simple custom line-icon illustrations in the ember/teal palette rather than photo-real AI renders — consistent, on-brand, and honest about being pre-launch.
- Use a single consistent icon set (outline style, 2px stroke) for feature bullets instead of mixed imagery weights.
- Photography, if used, should show real dining/service moments (warm, low dof, candid) — not stock "generic laptop in cafe" imagery.

4.4 UI components

- Buttons: solid ember fill for primary actions, teal or ink outline for secondary — rounded-medium corners (8–10px), never fully pill-shaped (keeps the technical, POS-software feel rather than consumer-app feel).
- Cards: soft 1px hairline border + very subtle shadow on hover, generous internal padding (24–32px) — the current three-pillar cards are text-only and feel empty; add an icon or screenshot to each.
- Section rhythm: alternate warm-paper and white/teal-tinted backgrounds to break up the page and give each section its own identity, rather than one long white scroll.
- Motion: light, functional micro-interactions only — ticket state changes, card hovers, number count-ups on stats. Nothing decorative that would undercut the "built for a busy kitchen" positioning.

5. Mobile & Responsive Priorities

Because two of the three product pillars (Waiter App, Customer App) are literally mobile experiences, the marketing site should demonstrate — not just describe — mobile confidence.

- Design mobile-first for the hero and pillar sections; the device mockups should be the first thing that resizes correctly, not an afterthought.
- Sticky "Book a Demo" button on mobile, collapsed nav behind a clear menu icon (not the current unlabelled "More").
- Keep feature bullet lists scannable on small screens — break the long Services-page lists into short, icon-led chunks rather than dense paragraphs.

6. Recommended Next Steps

- Agree the colour palette and typography pairing in this brief (or iterate once) before any screens are built.
- Source or produce real product screenshots for KDS, Waiter App and Customer App — this unlocks the hero, pillar cards, and "how it works" sections.
- Draft final homepage copy against the 9-section flow in Section 3.1, trimming repetition with the Services page.
- Fix all placeholder links (social icons, "Learn More" / "View More" destinations) as a pre-launch checklist item regardless of the redesign timeline.
- Design a simple pricing/contact path — even a single "Request a Quote" tier — so the site has a genuine conversion point.

Prepared as a design-direction reference ahead of build — happy to iterate on palette, layout or component details before this gets handed to development.
